Observable Universe

Distance to...

Speed of light = 300,000 kilometers per second

Around the Earth = 1/7 light seconds

Earth-Moon = 1 light seconds

Earth-Sun = 8 light minutes

Earth-Pluto = 5 light hours

Earth-nearest star (Alpha Centauri) = 4 light years

Earth-center of Milky Way = 26,000 light years = 8,000 parsec

Earth-nearest galaxy (Andromeda) = 2,500,000 light years

Earth-farthest supernova = 15,000,000,000 light years

August 2016: Astronomers detected an Earth-size planet orbiting the habitable zone of Proxima Centauri.

1 parsec = 3.3 light years

Hubble Ultra Deep Field

**10,000
individual
galaxies**

Para as escalas cosmológicas,
as galáxias - e seus bilhões de
estrelas e planetas - são...
pontos!

O que é a cosmologia (moderna)?

O que pretende descobrir?

1- A evolução do “tamanho” do universo

2- A evolução da estrutura em larga escala

$t = 0.21$ Gyr

400,000,000 anos luz

$t = 4.7$ Gyr

$t = 13.6$ Gyr

Consequências?

Inimagináveis!

Em particular, descobriremos a composição do universo e as leis da física que governam não somente nossa galáxia mas o universo inteiro.

Radiation:
0.005%

Chemical Elements:
(other than H & He) 0.025%

Neutrinos:
0.17%

Stars:
0.8%

H & He:
gas 4%

Dark Matter: 25%

Dark Energy: 70%

Como conseguirá o Brasil
fazer tudo isso?

Observando 100 milhões
de galáxias!

J-PAS: The Javalambre-Physics of the Accelerated Universe Astrophysical Survey

J-PAS was founded on the grounds of a MoU signed by CEFCA (Teruel, Spain), USP and ON.

J-PAS: The Javalambre-Physics of the Accelerated Universe Astrophysical Survey

Redbook: [arxiv.org / abs / 1403.5237](https://arxiv.org/abs/1403.5237)

The Javalambre-Physics of the Accelerated Universe Astrophysical Survey (J-PAS) is a narrow band, very wide field Cosmological Survey to be carried out from the Javalambre Observatory in Spain with a purpose-built, dedicated 2.5m telescope and a 4.7° camera with 1.2Gpix. Starting in 2017, J-PAS will observe 8500° of Northern Sky and measure $0.003(1+z)$ precision photometric redshifts for 9×10^7 LRG and ELG galaxies plus several million QSOs, about 50 times more than the largest current spectroscopic survey, sampling an effective volume of $\sim 14 \text{ Gpc}^3$ up to $z = 1.3$. J-PAS will be the first radial BAO experiment to reach Stage IV.
