Conclusions and comments

Electromagnetism provides a simple example in which one can illustrate the main ideas.

The question is : what are the asymptotic symmetries of electromagnetism?

Studies at null infinity show that these are the infinite-dimensional angle-dependent $u(1)$ transformations,

$$\delta A_\mu = \partial_\mu \epsilon, \quad \epsilon = \mathcal{O}(1) \quad \Leftrightarrow \quad \epsilon = \epsilon(x^A).$$

(x^A = angles on the sphere)

How can one see that at spatial infinity?

Conclusions and
comments

These parity conditions are thus fulfilled by the Liénard-Wiechert potentials (up to a gauge transformation).

They are also fulfilled by the electromagnetic field of a magnetic monopole (up to a gauge transformation).

From the point of view of containing the known solutions, these boundary conditions seem therefore acceptable.

Conclusions and comments

We now turn to the computation of the asymptotic symmetries.

Asymptotic symmetries and charges

The asymptotic structure of gravity II

Marc Henneaux
(Université Libre de Bruxelles and Collège de France)

Introduction

Hamiltonian analysis

New boundary conditions

Boosts

Enhanced Symmetry

Conclusions and comments

We now turn to the computation of the asymptotic symmetries.

The physical asymptotic symmetry algebra is the quotient of all the gauge transformations preserving the boundary conditions by the ideal of “trivial” asymptotic symmetries, which have zero charges for all configurations obeying the boundary conditions.

Asymptotic symmetries and charges

The asymptotic structure of gravity II

Marc Henneaux
(Université Libre
de Bruxelles and
Collège de
France)

Introduction

Hamiltonian
analysis

New boundary
conditions

Boosts

Enhanced
Symmetry

Conclusions and
comments

We now turn to the computation of the asymptotic symmetries.

The physical asymptotic symmetry algebra is the quotient of all the gauge transformations preserving the boundary conditions by the ideal of “trivial” asymptotic symmetries, which have zero charges for all configurations obeying the boundary conditions.

We must therefore both determine the asymptotic gauge transformations that preserve the boundary conditions and compute the value of their generators.

Introduction

Hamiltonian
analysis

New boundary
conditions

Boosts

Enhanced
Symmetry

Conclusions and
comments

In polar coordinates, the conditions read

$$\bar{A}_r(-x^B) = -\bar{A}_r(x^B), \quad \bar{\pi}^r(-x^B) = \bar{\pi}^r(x^B)$$

(because the leading order $\bar{A}_r$ is gauge invariant), and

$$\bar{A}_A = \bar{A}_A^{\text{even}} + \partial_A \bar{\Phi}, \quad \bar{\pi}^A(-x^B) = -\bar{\pi}^A(x^B)$$

with

$$\bar{A}_A^{\text{even}}(-x^B) = \bar{A}_A^{\text{even}}(x^B)$$

with no parity conditions on $\bar{\Phi}$.

With these new boundary conditions, the potential possesses, in addition to the even part characteristic of the previous boundary conditions, an odd part (equal to a pure gradient), which is called the “parity-twisted component”.

Are these conditions acceptable?

Is the symplectic form finite?

The radial part is clearly ok,

but what about the angular part $\int d^3x \pi^A \dot{A}_A$?

For this term to be finite, $\int d^2x \bar{\pi}^A \dot{\bar{A}}_A$ should vanish.

We impose $\partial_A \bar{\pi}^A = 0$, which is equivalent to the request that the leading order $O(r^{-1})$ in $\partial_i \pi^i$ be absent.

However, if $\mu = \frac{\bar{\mu}}{r} + \mathcal{O}(r^{-2})$ with $\bar{\mu} \neq 0$, the bulk integral $\int d^3x \mu \pi^0$ is not a well defined Hamiltonian generator and must be supplemented by the surface integral $-\oint d^2x \sqrt{\gamma} \bar{\mu} \bar{A}_r$,

$$G[\mu] = \int d^3x \mu \pi^0 - \oint d^2x \sqrt{\gamma} \bar{\mu} \bar{A}_r.$$

When the constraints hold, $G[\mu] = -\oint d^2x \sqrt{\gamma} \bar{\mu} \bar{A}_r \neq 0$. It generates therefore an improper gauge transformation.

$$G[\mu] = \int d^3x \mu \pi^0 - \oint d^2x \sqrt{\gamma} \bar{\mu} \bar{A}_r.$$

When the constraints hold, $G[\mu] = -\oint d^2x \sqrt{\gamma} \bar{\mu} \bar{A}_r \neq 0$. It generates therefore an improper gauge transformation.

The new symmetry is just a shift by the arbitrary odd function of the angles $\bar{\mu}$ of the coefficient $\bar{A}_0$ of the leading term in the expansion of A_0 .

$$\delta_{\mu} \bar{A}_0 = \bar{\mu}.$$

One can show that the leading logarithmic term (which is $r^2 \log r$ for the field strengths) is eliminated by our parity conditions, but subdominant logarithms will be present.

The Poincaré transformations and the new angle-dependent $u(1)$ symmetry have the algebra :

The Poincaré transformations and the new angle-dependent $u(1)$ symmetry have the algebra :

$$\{P_{\xi_1, \xi_1^i}, P_{\xi_2, \xi_2^i}\} = P_{\hat{\xi}, \hat{\xi}^i},$$

$$\{G_{\mu, \epsilon}, P_{\xi, \xi^i}\} = G_{\hat{\mu}, \hat{\epsilon}}, \quad \{G_{\mu_1, \epsilon_1}, G_{\mu_2, \epsilon_2}\} = 0,$$

$$\hat{\xi} = \xi_1^i \partial_i \xi_2 - \xi_2^i \partial_i \xi_1, \quad \hat{\xi}^i = \xi_1^j \partial_j \xi_2^i - \xi_2^j \partial_j \xi_1^i + g^{ij} (\xi_1 \partial_j \xi_2 - \xi_2 \partial_j \xi_1),$$

$$\hat{\mu} = \nabla^i (\xi \partial_i \epsilon) - \xi^i \partial_i \mu, \quad \hat{\epsilon} = \xi \mu - \xi^i \partial_i \epsilon.$$

Algebra

The asymptotic structure of gravity II

Marc Henneaux
(Université Libre de Bruxelles and Collège de France)

Introduction

Hamiltonian analysis

New boundary conditions

Boosts

Enhanced Symmetry

Conclusions and comments

The Poincaré transformations and the new angle-dependent $u(1)$ symmetry have the algebra :

$$\begin{aligned}\{P_{\xi_1, \xi_1^i}, P_{\xi_2, \xi_2^i}\} &= P_{\hat{\xi}, \hat{\xi}^i}, \\ \{G_{\mu, \epsilon}, P_{\xi, \xi^i}\} &= G_{\hat{\mu}, \hat{\epsilon}}, \quad \{G_{\mu_1, \epsilon_1}, G_{\mu_2, \epsilon_2}\} = 0, \\ \hat{\xi} &= \xi_1^i \partial_i \xi_2 - \xi_2^i \partial_i \xi_1, \quad \hat{\xi}^i = \xi_1^j \partial_j \xi_2^i - \xi_2^j \partial_j \xi_1^i + g^{ij} (\xi_1 \partial_j \xi_2 - \xi_2 \partial_j \xi_1), \\ \hat{\mu} &= \nabla^i (\xi \partial_i \epsilon) - \xi^i \partial_i \mu, \quad \hat{\epsilon} = \xi \mu - \xi^i \partial_i \epsilon.\end{aligned}$$

The algebra of the symmetries is a semi-direct sum of the Poincaré algebra and the abelian algebra parametrized by $\bar{\mu}$ and $\bar{\epsilon}$.

The Poincaré transformations and the new angle-dependent $u(1)$ symmetry have the algebra :

$$\begin{aligned} \{P_{\xi_1, \xi_1^i}, P_{\xi_2, \xi_2^i}\} &= P_{\hat{\xi}, \hat{\xi}^i}, \\ \{G_{\mu, \epsilon}, P_{\xi, \xi^i}\} &= G_{\hat{\mu}, \hat{\epsilon}}, \quad \{G_{\mu_1, \epsilon_1}, G_{\mu_2, \epsilon_2}\} = 0, \\ \hat{\xi} &= \xi_1^i \partial_i \xi_2 - \xi_2^i \partial_i \xi_1, \quad \hat{\xi}^i = \xi_1^j \partial_j \xi_2^i - \xi_2^j \partial_j \xi_1^i + g^{ij} (\xi_1 \partial_j \xi_2 - \xi_2 \partial_j \xi_1), \\ \hat{\mu} &= \nabla^i (\xi \partial_i \epsilon) - \xi^i \partial_i \mu, \quad \hat{\epsilon} = \xi \mu - \xi^i \partial_i \epsilon. \end{aligned}$$

The algebra of the symmetries is a semi-direct sum of the Poincaré algebra and the abelian algebra parametrized by $\bar{\mu}$ and $\bar{\epsilon}$.

The action of the Poincaré subalgebra characterising this semi-direct sum is :

$$\delta_{(Y, b, T, W)} \bar{\mu} = Y^A \partial_A \bar{\mu} - \bar{D}_A (b \bar{D}^A \bar{\epsilon}), \quad \delta_{(Y, b, T, W)} \bar{\epsilon} = Y^A \partial_A \bar{\epsilon} - b \bar{\mu}.$$
